Notes:
1. Proposed Normal Pool (Full) Level is 534 ft. Mean Sea Level (MSL). This is the level at which water would flow over a spillway.
2. Elevation 541 ft. Mean Sea Level (MSL) is the 100 year flood level. It is also the elevation of the emergency spillway and the level to which NTMWD will purchase property.
3. Elevation 545 ft. Mean Sea Level (MSL) is the 500 year flood level. NTMWD will purchase a flood easement between 641 ft. MSL and 545 ft. MSL. Property owners would retain ownership of this property. However, no habitable structures should be built below this elevation.
4. All property lines and lake boundaries are approximate. A ground survey should be done before building any permanent structure to confirm the building site is above the 545 ft. MSL elevation.
5. The number inside the parcel indicates the county tax record property ID number for any property parcel that would have any portion of the property affected by the lake or the flood easement up to 545 ft. MSL.
6. Map prepared by North Texas Municipal Water District, 505 E. Brown Street, Wylie, TX 75098. Additional information on the proposed Lower Bois d’Arc Creek Reservoir is available at www.ntmwd.com or by calling 972-442-6405.
